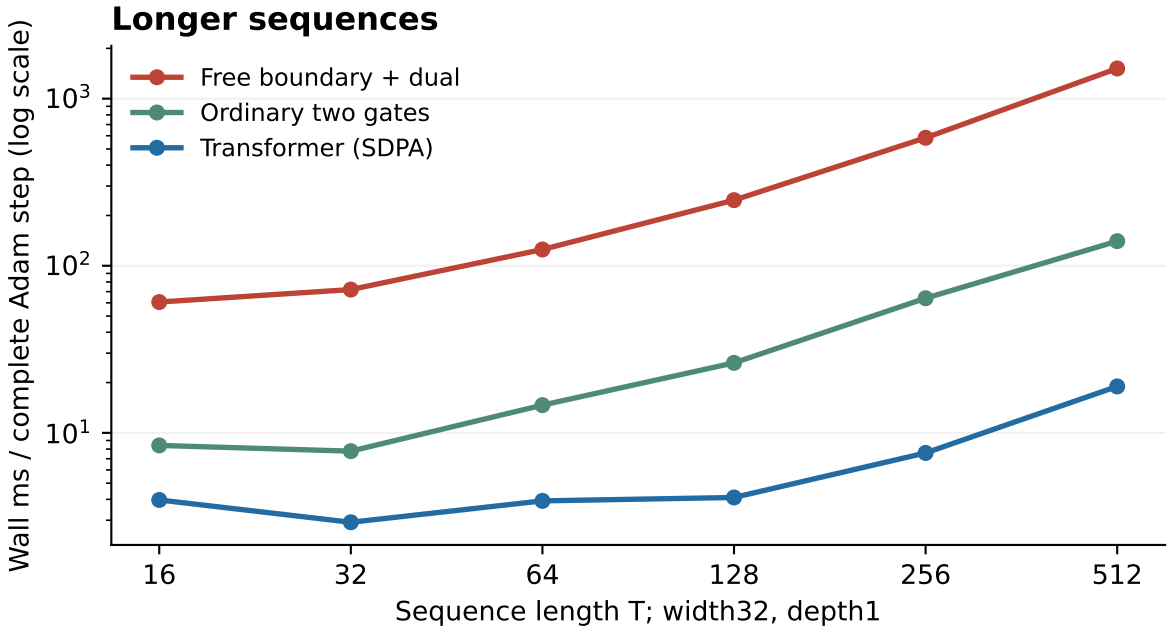
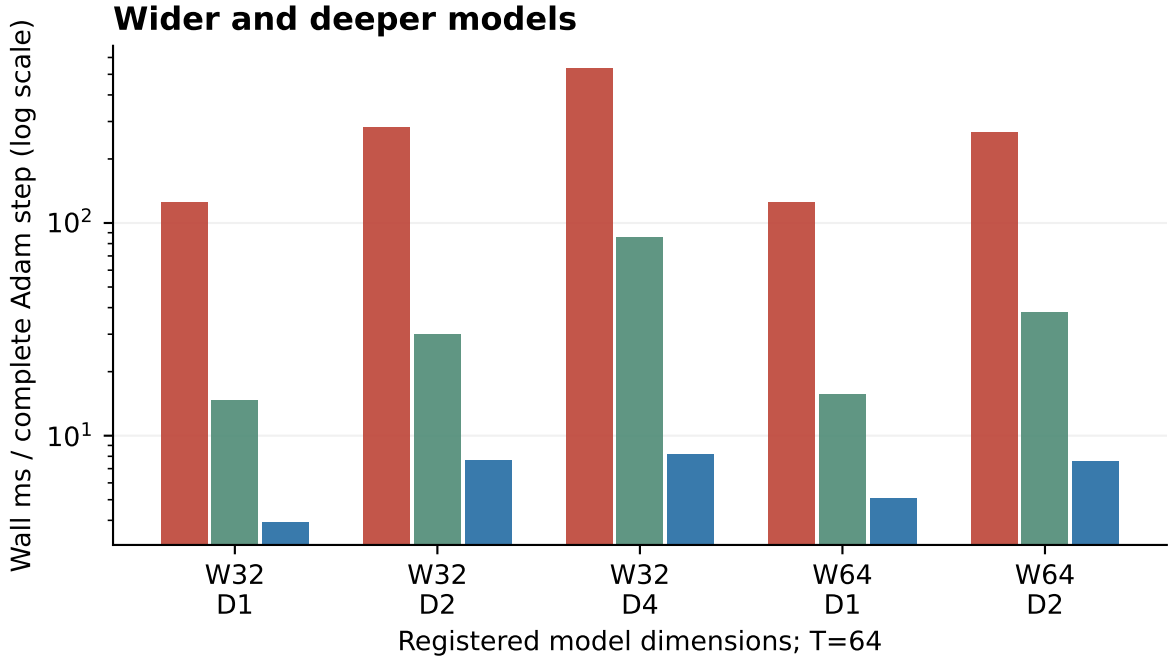
CPU execution scaling: complete updates, up to 105,492 parameters





B=1, float32, one thread. Median of 3 measured steps after one warmup. All 30 cases attempted; 0 failed (omitted, never imputed).
Wall time includes scheduling waits. Short-operation CPU clocks include unresolved zero increments; raw CPU medians remain in the report.
SCALING002 keeps the original 30 cases/timing with explicit supplemental-audit admission. Original failed summarizer + read-only repair retained.
Finite checks are included. Separate timing contract from the B=4 plot; random weights, no content, GPU or energy conclusion.
