Simplified C1 value-field candidate — separate from the frozen financial kernel
A. Stable equilibrium versus sustained excursion
$x = \log(V/b)$
Time (arbitrary units)
$\gamma = 0.2$
$\gamma = 0.8$
B. Repeated smooth pulses with saturated plateaus
Continuous risk observable R
Time (arbitrary units)
C. Phase portrait; boundary crossing has no reset
Restoring state a
x
D. Actual fixed-step convergence
$\max_{0 \le t \le 800} |x_h - x_{h/2}|$
Coarse step h (compared with $h/2$)
$\gamma = 0.2$
$\gamma = 0.8$
